Project proposal template – Faculty studentships Summer 2014			
<i>Project title</i>	<input style="width: 90%;" type="text" value="Novel Organic Semiconductors"/>	<i>Director of Study</i>	<input style="width: 90%;" type="text" value="Richard Singer"/>
<i>Second Supervisor</i>	<input style="width: 90%;" type="text" value="Prof Peter Foot"/>	<i>School</i>	<input style="width: 90%;" type="text" value="Pharmacy and Chem"/>
<i>Other members of supervisory team</i>	<input style="width: 90%;" type="text" value="Prof Peter Spearman"/>	<i>Any requirements from applicant (eg degree in specific subject area)</i>	<input style="width: 90%;" type="text" value="Chemistry preferred other physical molecular sciences may be acceptable"/>
Project summary (max 1,000 characters)			
<p>Organic field-effect transistors (OFETs) are exciting new electronic devices with applications in smart cards, electronic ID tags, sensors and TV screens. OFET circuits have advantages over inorganic ones: they can be made at low temperatures, on flexible substrates and at low cost. There is scope for new organic devices, such as chemical sensors, solar cells and lasers.</p> <p>At Kingston we have produced new ladder-structure (L) semiconductors, including a 5-ring oligomer L5H₂, 7-ring L7H₂, 9-ring L9H₂ and a high polymer. Prototype OFETs have been prepared. L5H₂ is similar in structure to the commercial semiconductor pentacene, but is much easier to synthesise and more stable.</p> <p>In this project, OFETs and new solar-cell devices will be made from L5H₂ and L7H₂ and studied by current-voltage and photoelectric measurements. The effect of processing on the materials properties will be correlated with structural changes revealed by electron microscopy and x-ray diffraction. Computer modeling will be used to predict and rationalise the trends in the bandgaps and optical spectra of the oligomers and to design new compounds, using molecular orbital software (eg Gaussian, Scigress, GAMESS).</p>
